

Git Commands	Descriptions
git status	provides information about what branch you are on, what is staged, and some other useful information. *If you forget where you are or what you are doing in git, git status is a good place to start to get back on track*
git checkout -b [new branch name]	create a new branch
git stash	stash away what you are working on on a branch (useful if you need to switch to a different branch without committing your code)
git stash pop	"unstash" the last thing you stashed
git add .	stages all your files to be able to commit them
git add [file]	stage a specific file to be able to commit it
git commit -m "[message]"	commit a file with a message
git merge [branch]	merge the branch you are on with [branch]
git clone <url>	clone a repo
git diff [file1] [file2]	check the difference between [file1] and [file2]
git push	push your code up to github
git pull	pull code down from github
git log	look at your past commits

Linux Commands	Descriptions
ls	list files and directories you have access to based on your current location
cd	change directory
pwd	see your current location
mkdir	make a directory

mv [file]	move a file
rm [file]	remove a file (be careful with this, you can't get it back)
cat [file]	look at a file
nano [file]	editing tool for files in cmd line
vim [file]	another editing tool for files in cmd line
ps	look at processes running on your machine

ROS Commands	Descriptions
ros2 launch <package_name> <executable_name>	launch ros code
ros2 run <package_name> <executable_name> --ros-args -p <param_name>:=<value>	launch rose code with parameters
ros2 launch surface_main surface_all_nodes_launch.py	How to run our code
rqt	Lets you see the running nodes and topics in a map
